

WMC Tasksheet Modul 4 – 01

Review: Exercise_4_401_react_review_olympics / Winter Olympics Dashboard

Complete all tasks from the [lesson](#) on your review Olympics project. Track your [progress](#) and upload the project to Ilias.

exercise_4_401_react_review_olympics / Winter Olympics Dashboard

- Task 1 - Create a Basic Component
 - OlympicsHeader.jsx
 - It should be rendered in App.jsx
 - Title: "Winter Olympics Dashboard"
 - Subtitle: "React Review Project"
 - Question: Explain how the import and export statements work
- Task 2 - Create AthleteCard Component
 - AthleteCard.jsx
 - Properties:
 - name
 - country
 - sport
 - Render the properties accordingly
 - Render 3 AthleteCards in App.jsx (look up or random data)
 - Question: Why should properties never be modified?
- Task 3 - useState (Local State medalCounter)
 - AthleteCard.jsx
 - Hold the medal count of the Athlete in the local state
 - Display the number of medals, a "+" button, a "-" button, a "Reset" button
 - Question: Can the state variable be updated directly?
- Task 4 - Event list rendering
 - Events.jsx
 - Hold a list/array of events in the local state (look up or random data)
 - Each event consists of
 - id
 - date
 - name
 - location
 - Render all events and implement a delete button per event
 - Question: Explain the syntax of Array.map

exercise_4_401_react_review_olympics / Winter Olympics Dashboard

- Task 5 - form / useEffect / Fetch country flag
 - Countries.jsx
 - Create a form with a "country name" as input field and a "search" button
 - Lookup the country flag via the API
 - `https://restcountries.com/v3.1/name/<country>?fields=flags`
 - Render the flag of the country as an image, if it can be found, otherwise show an error message
 - Question: Explain how useEffect works
- Task 6 - React Router
 - Install and integrate react router
 - Add a layout with navigation bar
 - Support the following routes/mappings
 - /
 - /events
 - /events/:id
 - /countries
- Task 7 - useParams Event Details
 - Add a Details button to each event in Events.jsx
 - EventDetails.jsx
 - use useParams to parse the event id from the route
 - Render the event details and highlight if the event has already been taken place based on the date
 - Note: it is necessary to move the place where the events data is stored from Events.jsx to the App.jsx (or where the router is configured)
 - Question: Explain how a callback can be passed as a property
